

HR Automation Dashboard

Assessment Assignment

Objective

Build an automated, Excel-based HR dashboard that consolidates employee data for India and US geographies, provides real-time insights, and automates key HR alerts and reporting.

Dashboard Requirements

- Org-wise chart reflecting the reporting hierarchy of all active employees.
- Dashboard must be live-linked to all active data tabs and auto-update without manual intervention.
- Display data at a high level only; detailed data should be expandable on demand.
- Alert HR when an intern's Last Working Day (LWD) is due within the next 45 days.
- Alert HR when an employee's probation confirmation is due within the next 30 days.
- Include a Risk Report section that reflects data updated by HR directly in the Risk tab.
- Attrition rate (quarterly) to be auto-calculated from the Offboarded Resources tab.
- Dashboard must remain intuitive and uncluttered — avoid displaying raw data tables directly.

Workbook Structure

The workbook must contain the following tabs:

Tab	Data / Columns Required
India Employee Database	Employee ID, Name, Department, Designation, Reporting Manager, Skillset, DOJ, Employment Status (Confirmed / Under Probation). For interns: LWD to track internship end date.
US Employee Database	Employee ID, Name, Department, Designation, Reporting Manager, Current Allocation (%), CTC, Skillset, DOJ, Employment Status. For interns: LWD.
RM Data	Monthly allocation data for all resources — updated each month to feed live allocation figures into the dashboard.
Finance	CTC for all resources in Annual and Monthly breakdowns, in both INR and USD.
Productivity	Productivity average per resource — to be reflected on the dashboard at a summary level.
Risk Report	Maintained by HR. Dashboard must reflect any updates in real time.
Offboarded Resources	Records all employee exits. Used to auto-calculate the quarterly attrition rate on the dashboard.

Technical Notes

- Solution must be built entirely in Microsoft Excel.
- Use of formulas, conditional formatting, and data validation is expected.
- Macros or VBA may be used where needed to support automation or dynamic updates.
